

Minature Flanged Floating Support for miniature lead screws

Technical Notes

Generally used with small diameter lead screws - see technical pages for lead screw core diameters and end machining

required.

Use with fixed support unit (L1354). For required end machining of the lead screws see technical pages.

Tips

End machining of lead screws on request.

Precision lead screws

The high lead thread form maximises linear motion and minimises shaft rotation. The close tolerance, free running nuts are individually matched to their lead screws and are ideal for miniature applications requiring rotary to linear, or linear to rotary actuation.

Anti-backlash nuts

For applications requiring precision positioning there is now a newly patented Anti-backlash nut. This device, consisting of only three components, utilises the constant force of a compression spring to push two halves apart. This action eliminates any play (backlash) which exists between the internal thread of the nut and the external screw thread.

To ensure accuracy and repeatability the nut can be fine tuned through the use of many available spring constants, to meet any preload design requirements.

Lead screw specification	High precision lead screw							
Lead error	±0,2mm/300mm							
Repeatability	0,01mm							
Straightness	0,03mm/100mm							
Backlash	0,08mm (zero when using anti-backlash nut)							
Temperature range	-30°C to +90°C							

Design considerations

Critical speed

The critical speed of a lead screw is the maximum speed (rpm) before the screw will become dynamically unstable. This results when the forced frequency of the rotating screw corresponds to its natural frequency. Its value is dependent on the length of the screw, the diameter of the thread, and the support configuration. The critical speed value is governed by the following equation.

Critical screw speed (RPM) = $K \times C \times 10^6 \times (d/L^2)$

Where;

K = End support factorC = Material factor0,36 one end fixed, other free4,5 for Stainless Steel screws1,00 simple supports both ends1,6 for Aluminium screws1,47 one end fixed, one simpled = Root diameter of the screws2,23 both ends fixedL = Length between bearing supports

Technical Information

Load

In order to properly incorporate a lead screw into a design, load requirements must be taken into account. These numbers are based on the shear of the nuts and does not take shaft buckling into account. Wherever possible, nuts should be positioned so as to be put in tension, pulling the load. This eliminates the need for buckling considerations.

Listed below are some helpful formulae to assist in proper lead screw selection.

Where;

- F = Load
- L = Lead
- E = Efficiency (see product pages)

Precision Miniature Lead Screws

Overview

• Select the relevant size lead screw diameter and load required.

- These are precision, high helix lead screws from stainless steel (304 grade)
- We can cut length to suit and/or machine the ends to your requirements
- They have an accumulative lead error of ±0.20/300mm (C10 grade)
- The actual clearance depends on the nut selected L1350 standard flanged nut or L1351 antibacklash nut
- Nuts are very smooth running with little friction. They are made from plastic resin (PPS).
- The anti-backlash nuts are longer than the standard length nuts as they incorporate a spring pushing the two halves of the unit apart.
